

Ana Cira and Anna

- Dataset from Kaggle (Playground)
- Pictures of Seedlings (12 sorts)
- Important to recognise the good seedlings from the “bad” weed seedlings
- Goal: Train a network to recognise seedlings

Cleavers

Common Chickweed

Charlock

Common wheat

Blackgrass

Fat Hen

Maize

Sentless Mayweed

Small-flowered
Cranesbill

Shepperd's Purse

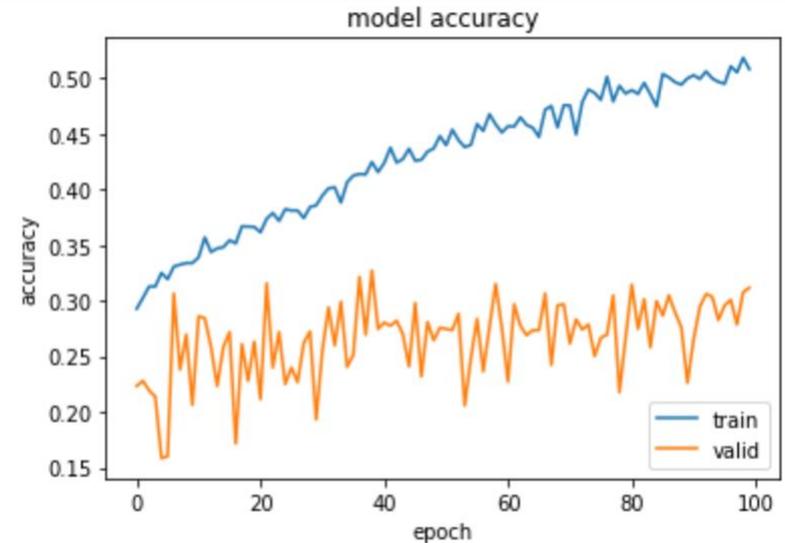

Loose SilkyBent

Sugar Beet

- Read the images (one class could not be read → 11 kinds of seedlings)
- Shuffle the Pictures and Labels
- Create Test, Training, Validationsets

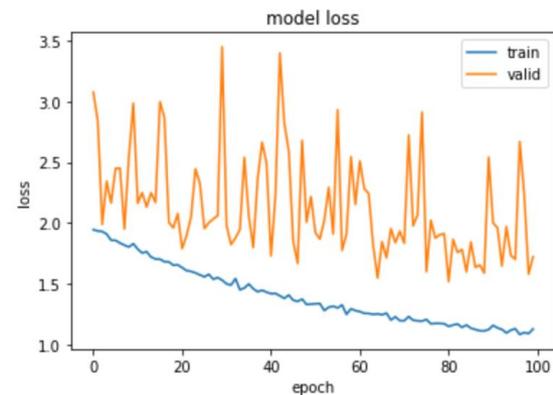

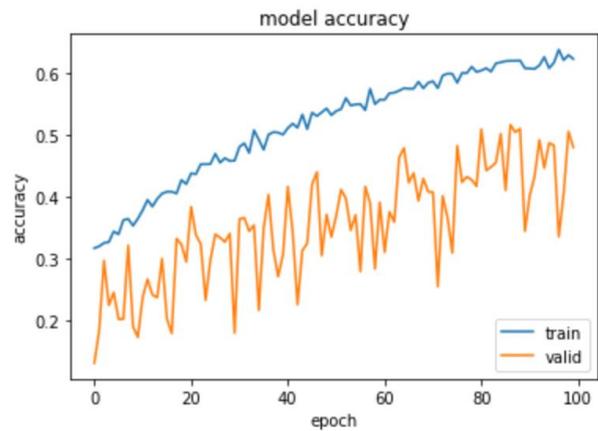

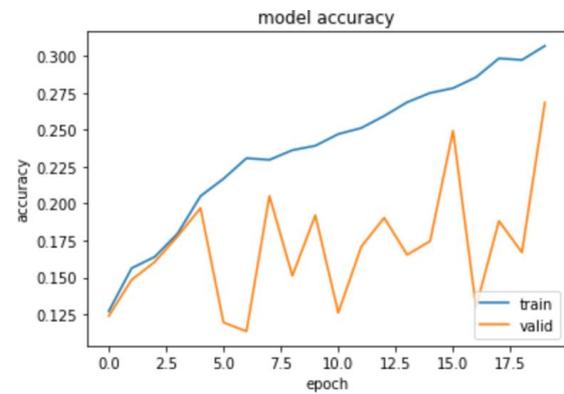

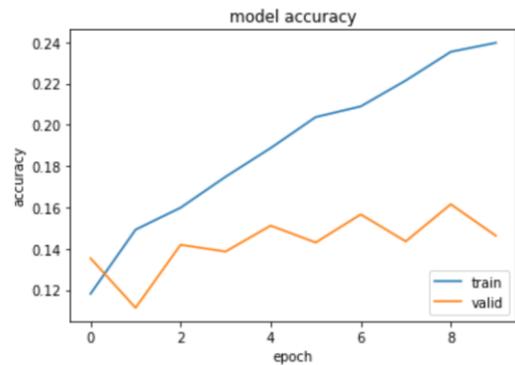

- Convolutional Neural Network with 3 Layers and Batch Normalization
- Data read in as RGB, reshaped but
 - not further processed
- **Unbalanced dataset?**
- **Not enough data?**

- Check whether data is balanced →
- Not really
- Rebalance the dataset

```
In [37]: ## check whether data is balanced  
pd.DataFrame(labels)[0].value_counts()
```

```
Out[37]: Loose Silky-bent          762  
Common Chickweed          713  
Scentless Mayweed         607  
Small-flowered Cranesbill  576  
Fat Hen                    538  
Sugar beet                 463  
Charlock                   452  
Cleavers                   335  
Black-grass                309  
Maize                      257  
Common wheat               253  
Name: 0, dtype: int64
```

- Make model simpler
- !! instead of validation set, the test set was given for validation !!
- Make dataset smaller → Result:
